Germany is cracking down on the coronavirus: Parliamentary inquiry committee hears from Sucharit Bhakdi – Switzerland remains silent

In the German state of Brandenburg, an official parliamentary inquiry committee is investigating the government's COVID-19 policies – including the vaccination campaign in which millions of Germans participated. The investigation is focusing on, among other things, the decision-making processes, the scientific basis of the vaccination strategy, and the potential risks and side effects of the vaccines.

Parliamentary committee scrutinizes coronavirus vaccinations

At the end of last month, the committee invited numerous experts to discuss the coronavirus vaccines. The agenda included, among other things, the role of the Standing Committee on Vaccination (STIKO), the risk assessment of the vaccines, the scientific basis of the vaccination strategy, and the mandatory vaccination of healthcare workers.

The appearance of emeritus Professor **Dr. Sucharit Bhakdi**, former head of the Institute for Medical Microbiology and Hygiene at the University of Mainz, received particular attention.

Bhakdi: The pandemic was planned years in advance

Bhakdi was highly critical. In his view, there are documents proving that the Corona pandemic was prepared years before 2020 and that the approval of gene-based vaccines represented the endpoint of a long-planned process.

As evidence, he referred to an internal protocol from the Robert Koch Institute (RKI) from April 2020. In his view, this showed that a large-scale vaccination campaign had already been decided early on – regardless of what scientific findings would later be obtained.

Furthermore, Bhakdi stated that the BioNTech vaccine had never been properly tested for safety and efficacy. He described the evidence submitted to the regulatory authorities as "simply fabricated." Moreover, citing documents, he argued that the manufacturing process had been quietly altered after the European Commission had already ordered hundreds of millions of doses, but before official approval. The product ultimately administered, therefore, was not identical to the vaccine tested in clinical trials.

Lipid nanoparticles and DNA impurities in focus

A significant part of his presentation dealt with the lipid nanoparticles that transport mRNA into the body cells.

Bhakdi explained that these artificial delivery systems were not used in healthy people before 2020 for medical reasons. He stated that they trigger a reaction in the body similar to blood poisoning – with a strong activation of the immune system and inflammatory processes in the brain, heart, lungs, liver, and kidneys. He assessed the resulting damage as irreversible.

Furthermore, he pointed to a changed manufacturing method in which genetically modified bacteria and so-called plasmids were used. This made it technically impossible to completely remove bacterial DNA from the final product.

Laboratory tests from several countries have detected DNA residues in various vaccine batches. According to the scientific studies cited by Bhakdi, this could lead to the integration of foreign DNA into human chromosomes, potentially with carcinogenic consequences. He also spoke of the long-term persistence of the injected material in the body, autoimmune reactions in almost all organ systems, and possible transmission to unborn children via the placenta.

Fraud, bioweapons labs and Bill Gates

Bhakdi did not limit himself to medical aspects, but also drew political connections.

He referred to earlier statements by Bill Gates, who, in the presence of then-Chancellor Angela Merkel, had declared his intention to vaccinate seven billion people. According to Bhakdi, this goal had nothing to do with public health, but rather with money and power. In his view, the enormous profits of pharmaceutical companies were the result of a system of organized deception.

In his closing remarks, Bhakdi cited information he claimed came from the highest levels of American intelligence. According to him, both the coronavirus and the vaccine were developed in biolabs in China and the USA. The perpetrators and those responsible were known by name.

With the seriousness of his statements before a parliamentary committee of inquiry, Bhakdi made it clear how deep the distrust of state institutions and official accounts now extends, even in parts of the academic world.

What does this mean for Switzerland?

While Germany is now investigating its Corona policy in an official parliamentary inquiry committee, a comparable investigation of the vaccination campaign in Switzerland has so far failed to materialize.

In Switzerland, too, there is currently no parliamentary committee of inquiry to comprehensively investigate the vaccination campaign and the political decisions.

While the potential risks of mRNA vaccines are increasingly the subject of scientific publications and legal proceedings worldwide, the political debate remains remarkably reserved in many countries.

Bhakdi's message to the parliamentary inquiry committee in Brandenburg was clear: such parliamentary investigations are not a luxury, but a necessity. In his view, the events of the years 2020 to 2023 should not remain unresolved.

The session was broadcast live and is available in the [Brandenburg State Parliament's media library](#). The investigative committee intends to continue its work in the coming months and gain further insights into the coronavirus policies and the handling of future health crises.
